Clivia miniata

Clivia miniata is a species of flowering plant in the genus *Clivia* of the family Amaryllidaceae, native to damp woodland habitats^[1] in South Africa. It grows to a height of about 45 cm (18 in), and flowers are red, orange or yellow, with a faint, but very sweet perfume.

CREeping SEDUMS

Creeping Sedums, also known as stonecrops

*Sedum*spp. and cvs.

(SEE-dum)

HARDINESS: The genus *Sedum* includes more than 400 species of succulent annuals, perennials, biennials, subshrubs, and shrubs native to the Northern Hemisphere. Many sedums in cultivation are creeping ground covers. There is at least one species hardy to each USDA Hardiness Zone. Most are hardy in Zones 4 to 9.

APPEARANCE: Mats of succulent leaves ranging from green to bluegray to reddish bronze are topped with five-petaled flowers in yellow, white, or pink. The leaves of evergreen species turn shades of red and russet in winter.

PROPAGATION: Propagate by seed in spring or fall or by division or cuttings from spring through midsummer.

USES : Plant in rock gardens, walls, pathway niches, and containers; as edging for borders; or in sweeps on hillsides.

CONDITIONS: Most creeping sedums thrive in full sun but will tolerate partial shade. They like poor or average well-draining garden soil; no supplemental watering is needed once they are established. They will not survive standing water for any length of time.
